

Osteospermum- Mini Orange (Westflower)

/100/ Mini Orange is an Osteospermum novelty. It is more than compact, this is an almost miniature Osteo! Free branching, this is great for small pots. It only gets 6 to 10" tall, and equally wide.

Osteospermum- often thought of as a cool weather gerbera, modern "Osteo's" are much more, performing very well in the Northeast as a landscape plant. These are best grown warm until established and then given a pinch and then grown cool. The best quality is achieved growing them cool in high light.

Osteospermum- FlowerPower™, Flower Power Spider, Zion and Kenai Series (Selecta First Class)

/100/50/ **Selecta First Class** is the top supplier of Osteospermum in Europe, and for good reason. They offer a very wide selection of both colors and types, offered in several series.

The FlowerPower™ series is available in many colors, and flower forms, broken into three different sub series. All three sub series are intended for early and mid season sales.

The FlowerPower™ Compact sub series are more naturally compact and more suitable for small pots (4" to 6") or in combination.

Members of the main **FlowerPower™** sub series are intended for general use, and offer excellent branching and relatively compact growth characteristics. They are offered in many colors. Though they can be used for small pots, they are better in larger sizes (6" and larger).

The **FlowerPower™ Spider** sub series consists of varieties which all have unique spider spoon-petaled daisy flower forms. These are slightly more vigorous than the FlowerPower™ series and are better in 6" and larger Pots.

The Zion series have medium to vigorous growth habit and are intended for 6" and larger pots and mixed containers. All have large flowers, with pronounced eyes which give them a bi-color look. These unique colors offer tremendous consumer appeal. They are early to flower and have a good deal of heat tolerance, flowering into the summer. These are best when planted later, under higher light, for mid season.

The Kenai series are interspecific hybrids, which have been bred to have more heat tolerance. These flower right into the summer and should be both planted and sold later than traditional Osteo's. These are compact compared to similar yellow and orange hybrids on the market, but are somewhat taller than the FlowerPower™, and are best used in 6" and larger pots. These do best if grown warmer than traditional Osteo culture and should be both started later and sold later than the other varieties.

/100/ This quick growing premium accent plant has reddish-bronzed foliage with a bright rose center. It is a large, spreading landscape plant and is best used by itself in the landscape, sold as a pot, or in a mixed container. It thrives in the heat of summer and gets 24" to 36" tall and spreads 18" to 24". It is more sun tolerant than coleus.
